

Evans Technology, Inc. provides project management solutions, including software, consulting and training for a variety of industries.

Since 1985, we have served some of the world's most successful companies by enabling them to complete their projects on time and within budget using the most advanced project management technology and best practices. We help our customers manage the project life cycle, collaborate and access information, minimize risk and maximize ROI.

Professional Services

Evans Technology's services go far beyond traditional consulting. Our goal is to provide the tools and knowledge that enable your staff to complete projects on time and on budget using the most advanced project management practices. By equipping your staff and bringing them up to speed as quickly and efficiently as possible, we also enable you to minimize the continual use and expense of outsourced consulting services.

We begin with a thorough needs analysis and conduct each phase of the system implementation that's appropriate for your company. Even companies with staff who are certified as project managers will benefit greatly from our practice experience.

Our lengthy and well-versed track record allows us to develop project management solutions based on a bird's-eye view of industry-wide best practices and the latest technology.

Evans Technology will fully enable your staff with everything needed to successfully use their newly implemented system on their own. However, if necessary, our consultants can provide mentoring support on a continuing basis so that you can maintain consistency and confirm that your entire staff retains complete understanding.

Needs Analysis

Our project management consultants will conduct individual interviews and/or team meetings with key personnel to identify organizational responsibilities, current policies and procedures such as project life cycles, document control, scheduling, and data flow. System requirements including existing hardware & software, data conversion, integration, and backup procedures will also be reviewed to insure all requirements are met.

Based on the findings of the needs analysis, a preliminary requirements document is prepared. This requirements document will lay the ground work for a successful software implementation.

System Implementation

Our team approach to implementing customized project management solutions and our ability to provide the appropriate resources and support staff necessary for completion of each phase of the engagement insures a successful implementation.

We follow a proven implementation methodology which progresses from project planning to the post rollout support. However, this methodology can be tailored to specifically match the goals and objectives of each individual project to facilitate a successful implementation.

- Needs Analysis
- Design
- Prototype
- Project Pilot
- Rollout
- Post-Rollout Support
